

Installation

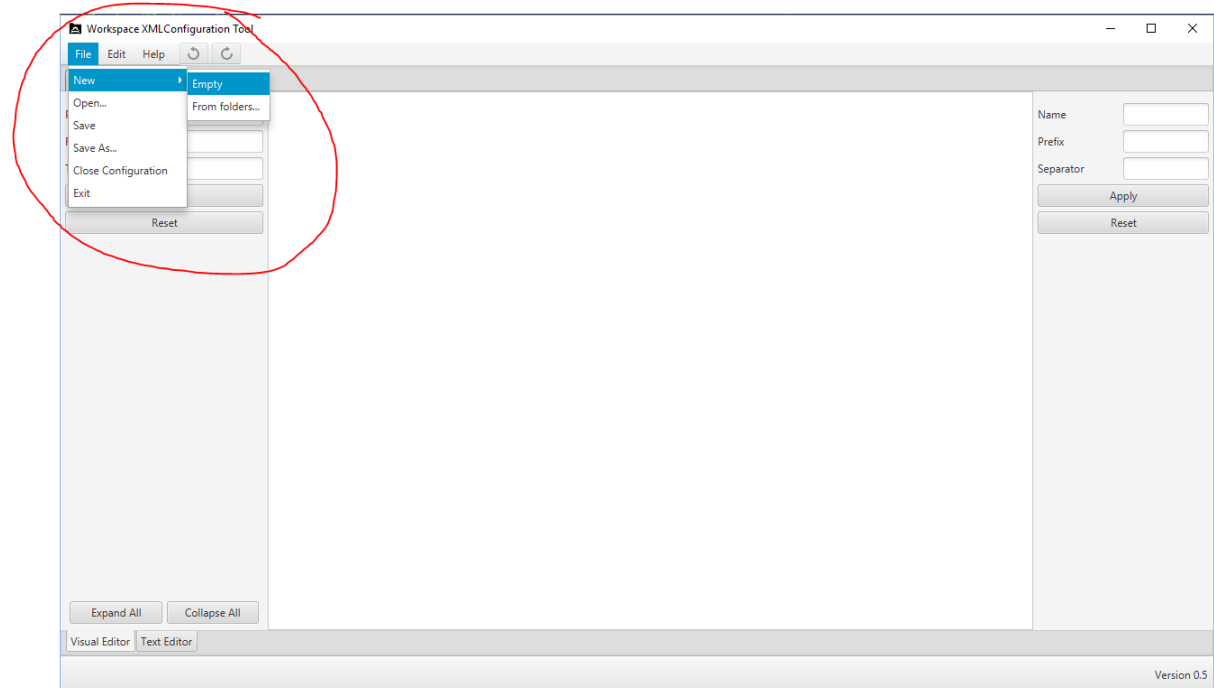

To install the Workspace Configuration Tool, download the executable Jar file to the desired location. In order to run the program the latest version of the Java runtime environment must be installed, which can be found at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

Creating a configuration

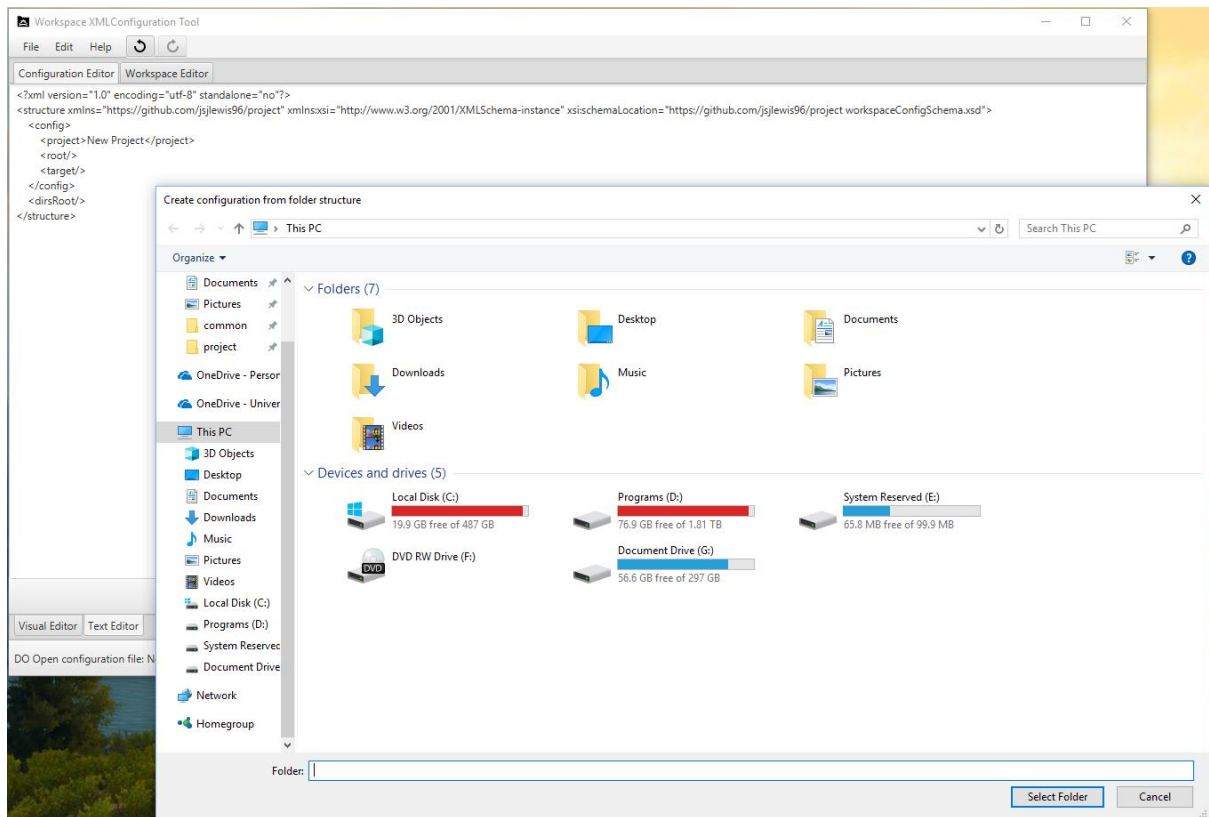

There are two ways of creation a new workspace configuration:

1. Create a new empty configuration
2. Create a new configuration from an existing folder structure

Both these options can be found by going to the top menu, File -> New...

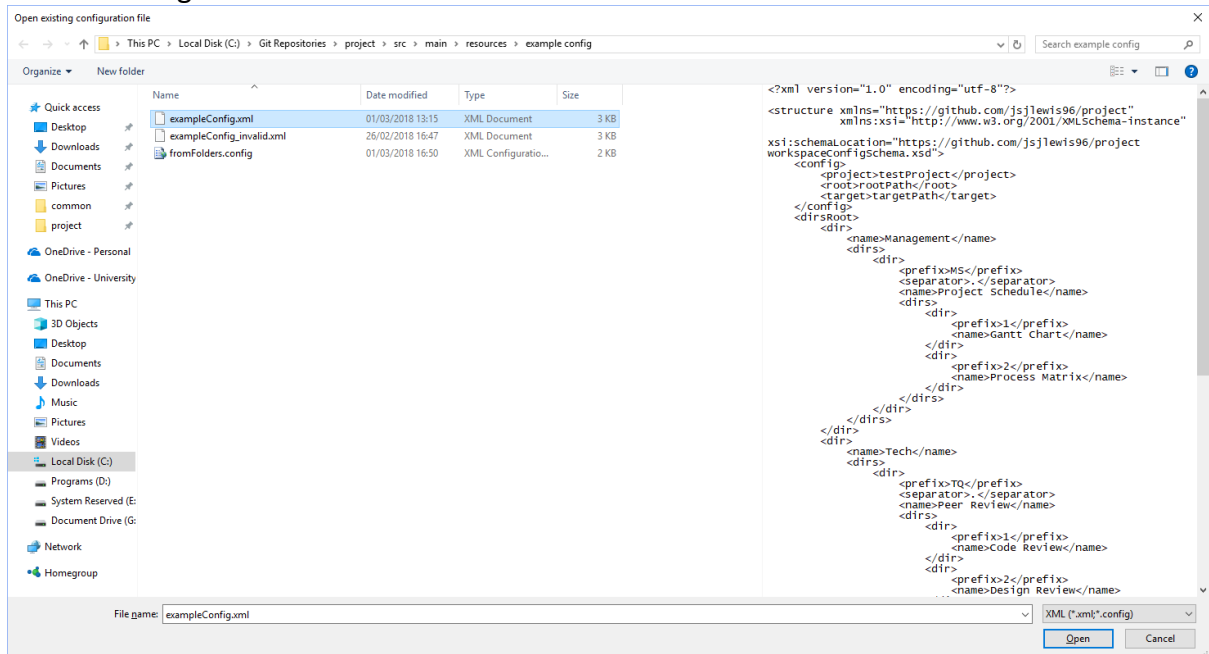

Where possible it is recommended to create a new configuration from an existing folder structure. In the diagram below you can see an empty configuration that has been loaded, and the dialog for creating a new configuration from folders.

Opening an existing Configuration

To open an existing configuration go to File -> Open... in the top menu, and select a valid .xml or .config file.

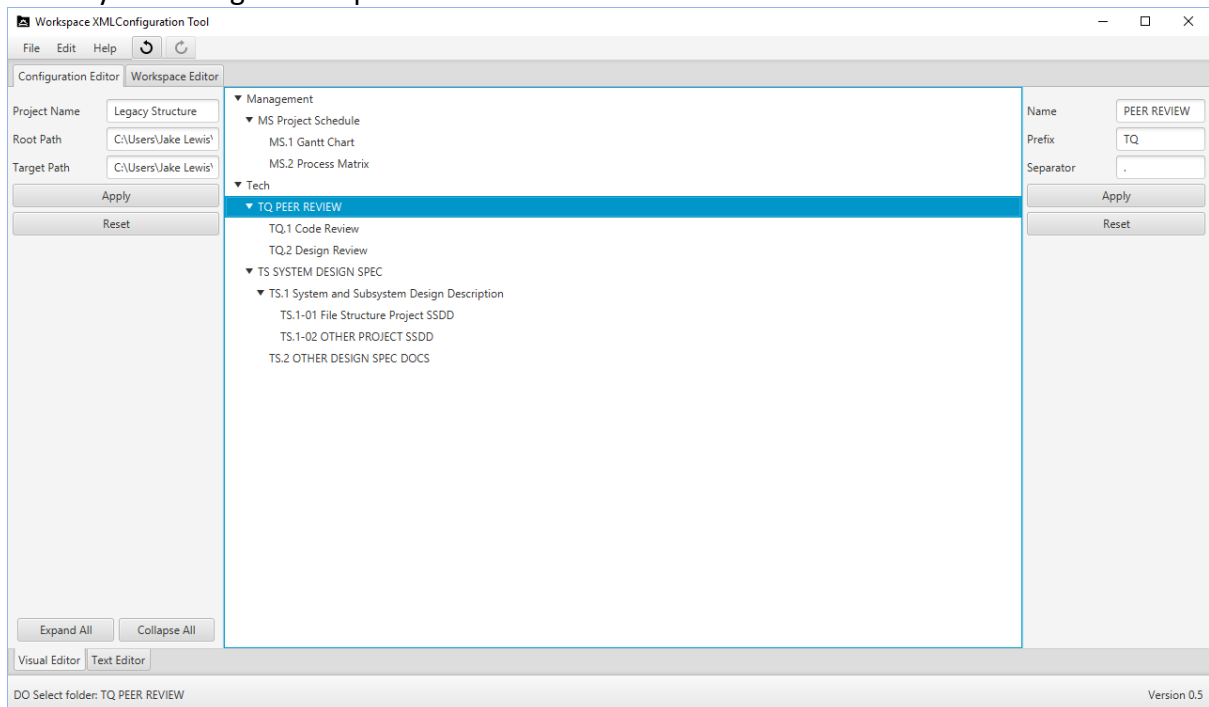

Saving a configuration

To save a configuration go the top menu: File -> Save, or File -> Save As...

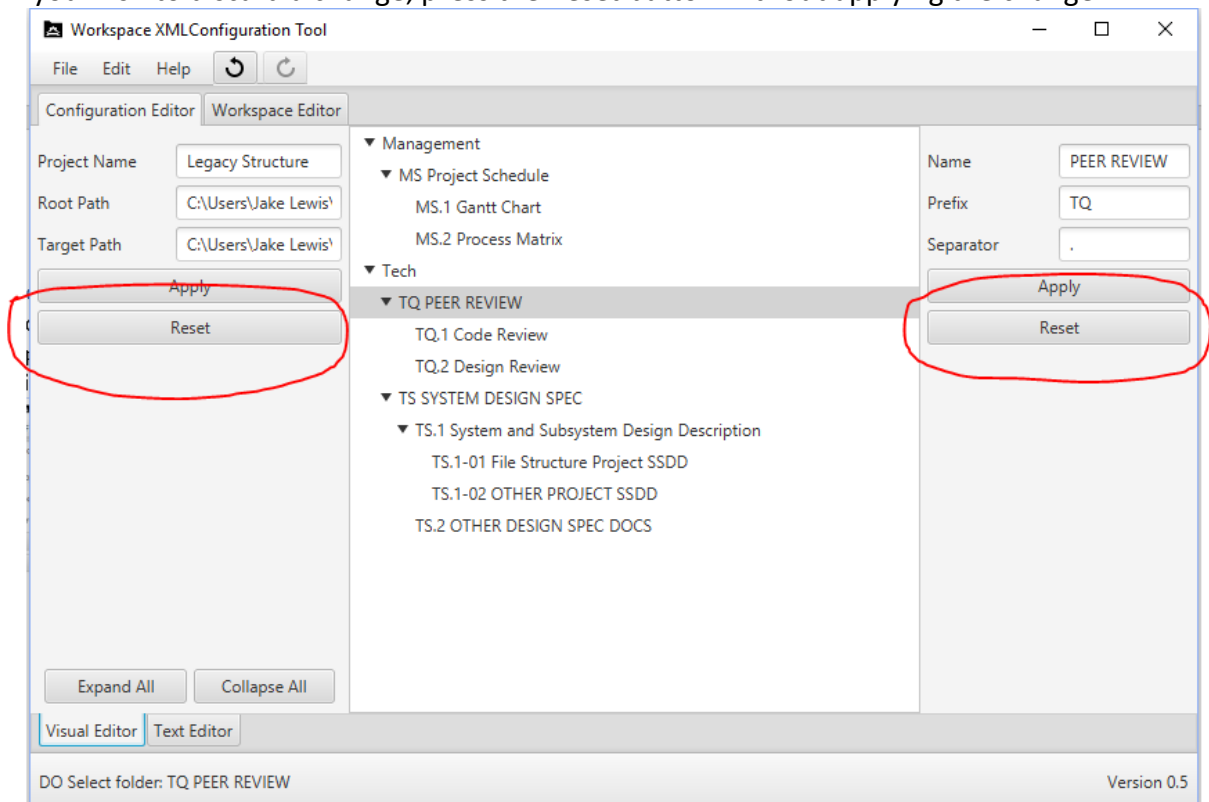

Editing a loaded configuration

To edit a loaded configuration, select the Configuration Editor tab, and select the field for the value you wish to edit, and press apply. The Configuration Editor -> visual editor also allows you to drag and drop items in the view to reorder them.

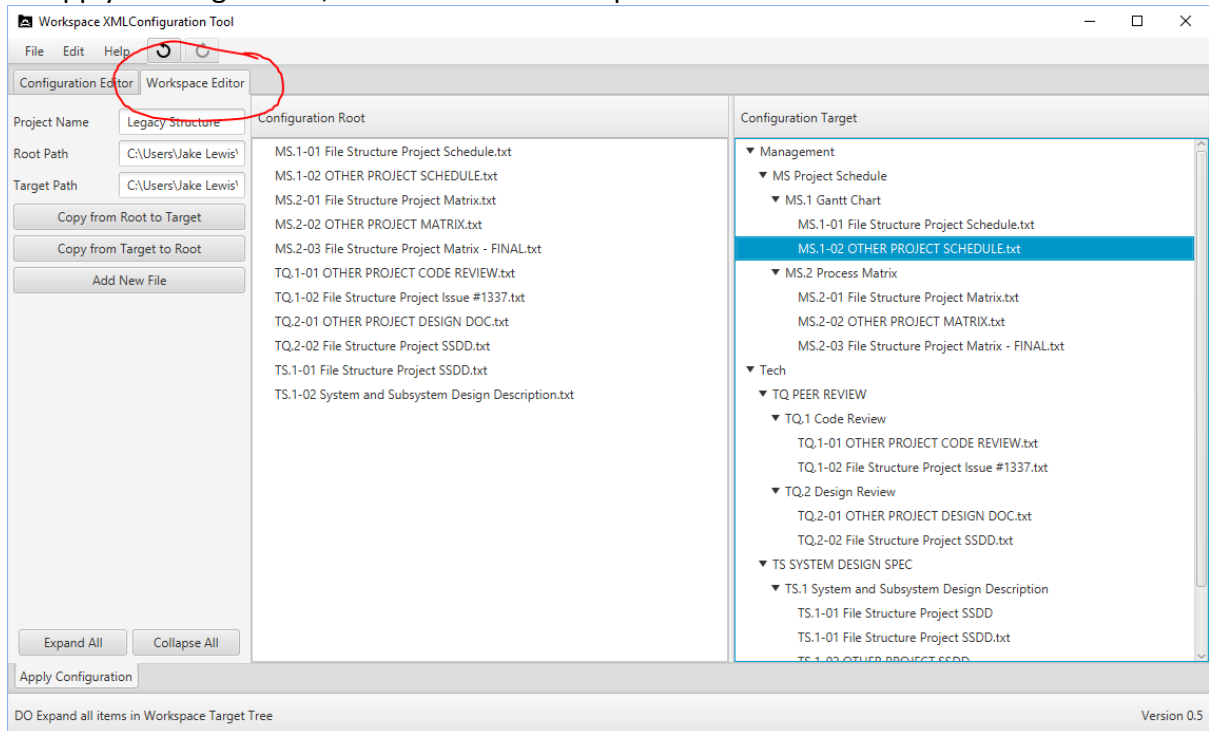

Creating a new directory can only be done in the text editor view.

If you wish to discard a change, press the Reset button without applying the change.

Apply a configuration

To apply a configuration, first select the Workspace Editor Tab.

The two “Copy” buttons on the left panel will allow you to apply a configuration to either the configuration root, or the configuration target, as shown in the two tree views.

Applying a configuration will copy all files from one file structure to the other, placing in the correct position as according to their file name prefix.

Undo & Redo

The Workspace Configuration Tool comes with undo & redo functionality. If the last action can be undone or redone, the buttons will be highlighted, if not they will be greyed out.
